

UniLynx Inverter Range

Single phase - with transformer - indoor and outdoor cabinets 1.8 - 3.0 - 3.6 - 5.4 kW

The PV system configurator helps users to design and dimension solar energy systems.

Three individual PV inputs and three dedicated MPP trackers form the multi DC string input.

Unique versatility

Multi DC string input

Due to the one to three string input, module mismatch losses and losses from partial shading are greatly reduced; if one string is not functioning optimally, the remaining two strings will continue production unaffected.

One inverter for 16 countries

All Danfoss inverters can run in 16 different countries and are configured on site. Just select the country at initial set-up and the inverter will configure itself to comply with regulations.

The inverter will automatically detect the wiring and run the appropriate configu-Individual/parallel configuration and up to 3 MPP trackers
The same inverter can run in both individual and parallel (master/slave) configuraration via the auto detection algorithm. configuration is ideal, as a designated MPP tracker is appointed for each string. tion, depending on the configuration of the wiring. If all panels are identical, have different angles or display different operation conditions, individual master/slave is the ideal configuration. When panels are of varying types, if they

5 inch or 6 inch modules and thin film

These dedicated input voltage ranges limit power losses and assure the string operating voltage is correct in order for the inverter to optimise total energy output. This transformer inverter also handles thin film modules. UniLynx comes in two input voltage ranges: High Voltage (HV), dedicated to 5-inch cell modules, and Medium Voltage (MV), dedicated to 6-inch modules.

Optimum energy output

 High MPP tracker efficiency
 Individual MPP trackers ensure the system always runs at optimum power of the MPP trackers has been tested at the Arsenal Research Institute in Vienna as well as in an ISORRIP test, in which representative sample data from a year's irradiation was used to calculate the efficiency. At static irradiation the MPP the MPP tracker efficiency is 99.4%. tracker efficiency is 99.9% (MPP European Efficiency). And at dynamic irradiation output regardless of size differences and PV module placement. The accuracy

Ride Through

All Danfoss inverters have a built-in algorithm called Ride Through. This algorithm ensures the inverter stays on grid even during severe grid disturbances. The inverters will only disconnect when AC grid limits set by the authorities are exceeded.

Easy communication and monitoring

Safe and easy to install and service

• **Derating function**Should the inverter come across conditions of increased grid voltage, increased Should the inverter come across conditions of increased grid voltage, increased current levels or too high ambient temperatures, it will limit the output accordingly to protect itself. This derating function means that the inverter will continue producing although conditions exceed inverter limitations. This will increase yield while ensuring the inverter is not damaged, and will in the long run ensure long life.

Early start-up and late stop of daily production
 Danfoss Solar Inverters use a combination of two MPP tracking methods, designed solely to work with both high and low irradiation levels, which ensures power production even with limited sun.

 RS485 communication
 All inverters can be fitted with RS485 cable system data logs for easy communication and monitoring of the investment. nverters can be fitted with RS485 cable system data loggers and webloggers

Standard connection for DC input and AC output
 Danfoss inverters cannot be configured wrongly: Just connect the inverter and the auto detection will register the DC-wiring of the inverter and configure

 Integrated DC switch
 For the protection of the installation engineer and service personnel, our inverters
have an integrated DC switch to enable PV power to be disconnected safely.
 Simply switching off the DC switch is enough to disconnect DC power from the
solar modules to the inverter. accordingly.

• Servicing on site

The Unilynx has a modular PCB design. All inverters have one AC PCB and for each string input a dedicated DC PCB. Each individual PCB can be quickly exchanged on site if necessary.

Service tool
 The software-based Service tool makes service extremely easy, allowing technicians to configure and monitor PV inverters and PV inverter networks, as well as updating software via an RS485 standard communication bus.
